

# Welcome to KYND Signals Client Report

Keeping pace with the evolving nature of cyber risk is an acute challenge for organisations in their efforts to obtain cyber coverage. KYND Signals Client Reports help overcome these challenges and are specifically designed to support you with prioritised, actionable insights into your cyber posture.

## What do KYND Signals Client Reports do for you?

Used by thousands of organisations worldwide to help them get a grip on their cyber exposure and obtain the right cyber coverage, these tailored, prioritised, and actionable risk insights offer:

**Clarity:** The reports transform complex risk data into clear, actionable insights

**Efficiency:** Thematic grouping of risks to make it more readable

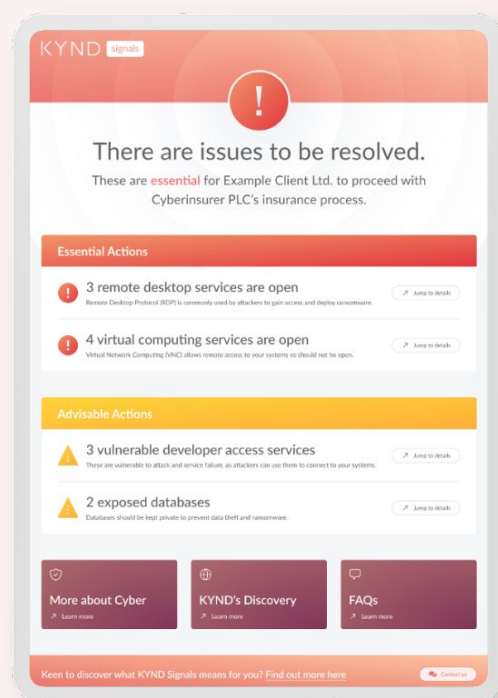

**Targeted action:** Actionable insights to help you prioritise the issues that are important for maintaining cyber resilience

## How does KYND work?

KYND can complete a comprehensive cyber risk assessment by analysing just one website registered by your organisation. It's a non-invasive evaluation that looks at over 250 cyber risk factors across domain registration, email security, and services. Specifically, KYND is looking for any exposed services or critical software vulnerabilities, because these are risks that would significantly increase the opportunity for cyber criminals to attack your organisation.

## Understanding your Client Report

Once you receive the report, our user-friendly colour-coded system simplifies the understanding of risk levels and recommended actions: Red, Amber, and Green refer to essential actions, advisable actions, and no action, respectively.

## KYND is here to help

Not only does KYND provide all of the above, but if you ever have any questions about the report's findings or what you need to do, you can get in touch with our friendly team of expert cyber advisors by emailing us at [support@kynd.io](mailto:support@kynd.io) or tapping the chat icon in your report.
